

A True Smooth Bore Flexible Chemfluor® PTFE Fluoropolymer Hose

FlexPro™ delivers
maximum flexibility and
best-in-class performance
in the most demanding
process environments.
FlexPro™ is the only hose
on the market that delivers
the flexibility you desire
and the smooth inner bore
you demand - flexible
enough to accommodate
the tightest installations
with an extremely, smooth
Chemfluor® PTFE inner
tube surface.

Features/Benefits

- Precisely engineered for true smooth bore ID with ultra flexibility
- Extremely smooth ID surface for unimpeded flow with no particle entrapment
- Reduced force to bend for easy handling
- Reduced minimum bend radius for versatile flexible connections
- High pressure rating for resilient performance
- Sterilizable for high purity
- Steamable for low TOCs and extractables
- Autoclavable to meet the highest sanitary standards
- Full vacuum rating for critical applications
- Broad temperature rating accommodates a wide range of environments
- Chemfluor® PTFE fluoropolymer liner imparts no taste or odor
- Highly chemical resistant to handle the most aggressive materials
- Patent pending

Typical Applications

- Skid transfer
- Pumping station/portable pumps
- Vessel or tank transfer
- Transfer lines
- Rail car loading or unloading
- WFI use point drops

- Clean steam drops
- Isolation from tanks on load cells
- Bioreactors process
- Bioreactors utility
- Process UF and chrome skids
- CIP skids
- Portable skids

- Finish fill process
- Finish fill SIP
- Rotary filling machines
- Fermentation transfer vessels
- Steam applications
- Food and beverage sanitary transfers

^{*}Coming soon. Note: When using Flare-Thru technology, pressure rating is for hose only.

Cover Options

Color options far platinum-cured silicone cover:

- Standard- Clear
- Special- Green, Blue, Red, Purple

 $\hbox{Color options far EPDM rubber caver:}$

- Standard- Grey
- Special- Green, Blue, Red, Purple

Fitting Options

 $PermaSeal^{\circledR}:$

 Over 40 styles of PermaSeal[®] crimped fittings

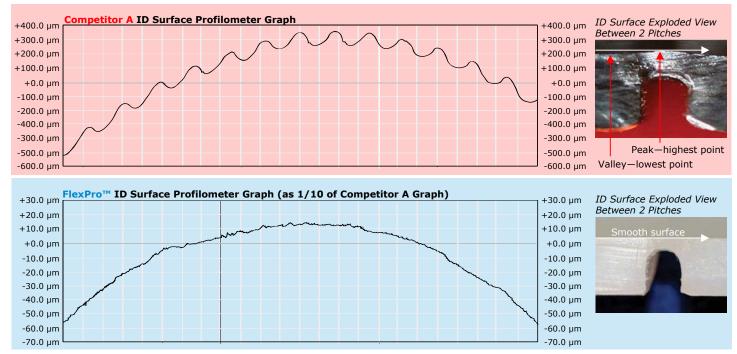

Flare-Thru:

- Sanitary clamp style
- 7 /8" available now
- Other sizes coming soon
- Can suit factory far other fitting styles

Inside Diameter Surface Roughness Comparison/Profilometer Graphs

Inside Diameter Surface Roughness Comparison/Numerical Data

Sample ID	Scan Location	Scan L (mm)	Ra (µm)	Rp (μm)	Rv (µm)	Rt (µm)	Rz Din (µm)
FlexPro	Longitudinal ID	49.5	0.1731	1.3804	1.9585	3.267	1.0699
Competitor A	Longitudinal ID	48.8	1.6038	6.7278	10.711	17.438	5.7084

Tubing ID Measurement Test Method:

Surface roughness analysis is performed using a Taylor Hobson FormTally-surf Contact profilometer. A 10 μm diamond stylus was used to measure scans longitudinally along the inside diameter at three parallel locations approximately 50mm in length. Each measurement was analyzed under two conditions. The raw data plot was reviewed to determine form and trough depth differences; the raw data was then analyzed for roughness using a Gaussian filter and an 0.8mm cutoff length to obtain Ra, Rv, Rp, and Rt values.

Terminology definitions (per ASME B46.1-1995):

Roughness Average (Ra)—the arithmetic average of the absolute values of the profile height deviations recorded within the evaluation length and measured from the mean line.

Maximum profile peak height (Rp)—the distance between the highest point of the profile and the mean line within the evaluation length.

Maximum profile valley height (Rv)—the distance between the lowest point of the profile and the mean line within the evaluation length.

Maximum height of the profile (Rt)—the vertical distance between the highest and lowest points of the profile within the evaluation length.

Permeation Test

Permeation is a natural property of fluoropolymers. The gas permeation test is designed to quantify the volume of gas that may pass through the wall of the hose for specified pressure, temperature and time. A small molecule, such as nitrogen, is used during the test, which consists of a pressurized hose being held under water for extended periods of time (typically 24-72 hours); the permeated gas is collected. The volume of gas collected can be divided by the time and length of the hose to normalize the data and yield volume/foot/hour data results.

FlexPro™ was tested according to this procedure and showed a result of 3.322 ml/ft/hour (10.899 ml/m/hour).

FlexPro™ Service Life Flex Cycle Impulse Test

Full/Open Flex Distance

The test evaluates properties affecting a hose assembly. Hose assemblies are typically affected by pressure, temperature, flexing and pressure pulsing of the application. The pulsing part of the application can significantly impact the performance of the assembly because the pressure pulse, although brief, is often significantly higher than the steady state pressure of the system.

The test applies pulsating pressure internally to the hose assembly while flexing the assembly from an open to a closed position. Impulse test parameters are based on SAE J343. Pressure impulse is cycled from 0 PSI to test pressure approximately 30 times/minute. Flexing is a 180° bend, which reduces the bend to the minimum bend radius. Flexing occurs between 5and15 cycles/minute. Fluid temperature is maintained at a constant level.

No failure was observed before testing was terminated.

Closed Flex Distance

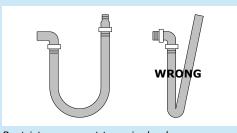

High Temperature 250°F, 400 PSI

Impulse Cycles	Flex Cycles
750,000	125,000

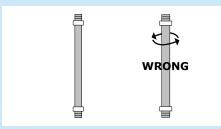

Room Temperature 91°F, 400 PSI

Impulse Cycles	Flex Cycles
500,000	250,000

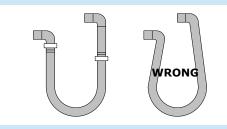

Helpful Installation Tips

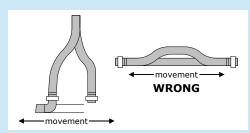

Restrict movement to a single plane

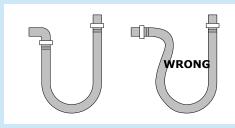

Minimize twisting (torque)

Never use hose below minimum bend radius

Eliminate axial movement No stretching or compression

Avoid severe bends Use 45° or 90° elbows
